

This proposal to use the power line infrastructure in this country for the distribution of wideband data would have have very deliterious results. The interference generated would render most if not all LF,MF,and HF radio frequencies useless for all but extremely stong signals.

This would have the effect of serious impact on the security of our country related to disaster communications conducted by amateurs as well as strategic and tactical military communications where the lower frequencies are used extensively as a back up for satellite circuits.

Do not allow this disaster to happen please.

Rod O'Connor
